The prod. of the third reading frame is the HPV-16 E6 protein whereas the second reading frame encodes HPV-16 E7. The E6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotheraspeutically to activate cells of the immune system against HPV. See also ARR27723-43. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
A variant of the human papilloma virus (HPV) E6 or elicits a humoral and/or cellular immune response in vaccines against HPV or to treat HPV infection.
                                                                                                                                                                       Vaccine variants of human papilloma virus antigens - contain variants of E6 and/or E7 protein, pref. deletion mutants, and are used to treat or prevent HPV infection.
                                                                                                          Example 1; Page 15-16; 37pp; English.

                                             AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce ar immune response in a patient to an HPV antigen. They can also be used f preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C- terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence is a full length E6/E7 fusion protein. (Updated on 27-AUG-2003 to correct OS field.)

                                                                 This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) 86 and 87 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (cLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce a immune response in a patient to an HPV antigen. They can also be used preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HPV fusion protein CLYTA-E6-His/HPV16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY25379

                                                                                                                                                                                                                                                                                                                                  This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Streptococcus pneunoniae CLYTA protein of the encoded protein. The protein can be used in a vaccine, for limmuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (20-127) the C-terminus of the equence represents an HPV-H. influenzae D protein, fusion protein of the

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours
                                                 This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of Etreptococcus pneunoniae CLYTA protein of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                                        Human Papilloma Virus (HPV) fusion proteins - useful treatment or prophylaxis of HPV induced lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Bruck C, Cabezon & Lombardo-Bencheikh

                                                                                                                              The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) B6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyca protein (CLyca) or thioredoxin. The present sequence represents an HPV-Lyta, fusion protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                  The present sequence represents an E7B6 fusion protein, comprising wild cype E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). C7 The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino C7 acids corresponding to amino acids 24, 26 or 91 of the sequence given in C8 ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of C8 there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated C9 cancers, such as cervical cancer. The fusion proteins and nucleic acids C9 cancers, such as cervical cancer. The fusion proteins and nucleic acids C9 cancers, the fusion proteins are useful for generating immune responses C9 against HPV. They are also useful for treating lower gastrointestinal C1 tract cancers, e.g. anal cancer, and other cancers of the reproductive C9 system, including penile and vulvar cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                    The present invention describes a polypeptide comprising a Ctranscriptional adaptor motif (TRRM) or a TRRM-interaction motif (TRIM) CC (I). (I) can be used for identifying compounds (II) comprising a CC (I). (I) can be used for identifying compounds (II) comprising a CC polypeptide capable of disrupting an interaction between a TRRM sequence and/or a TRIM sequence. Polypeptides which bind to a TRRM sequence or a CC TRIM sequence are identified by incubating, the polypeptide with (I) and CC determining if the polypeptide interacts with (I). Compound (II) is CC useful for preparing a pharmaceutical composition and for disrupting an interaction between TRAM sequence and TRIM sequence in vitro, thereby CC inhibiting viral transcription or cell cycle progression in mammalian CC cells especially cancer cell. Compounds which disrupt interaction between CC TRIM/TRAM containing polypeptides can be used therapeutically to prevent CC or treat viral diseases and tumours. The polypeptides reduce conceptibility of cells to viral infection and regulate cell cycle concluding apoptosis and growth arrest and can be used to produce concluding apoptosis and growth arrest and can be used to produce continuous against the TRIM or TRAM sequences. HPV types associated with risk or low risk of cervical cancer can be distinguished based on the present sequence represents a HPV-16 E6 protein amino acid conceptible of the present sequence represents a HPV-16 E6 protein amino acid conceptible conception the present sequence represents a HPV-16 E6 protein amino acid conceptible con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                response to an antigen in a patient. The method comprises administe to the patient an immunoglobulin (Ig) or its portion where the Ig is least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 158 AA;

This sequence represents an example of a modified immunogenic protein and corresponds to the E6 protein from human papillomavirus fused to the measles virus protein F signal peptide. The compositions, vectors and particles are used to treat or prevent cancers and tumours, specifically those associated with papillomavirus infection (e.g. cancer or low grade dysplasia of the cervix uteri).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses. ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for representing immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC clast three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV by strains. Also included are a CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 polypeptide in a sample (comprising the presence of an oncogenic HPV E6 polypeptide in a sample (comprising a first and a second binding partner for an oncogenic HPV E6 polypeptide. CC where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins CC of at least three different oncogenic HPV strains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches 108;

(I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The epitopes for inclusion in an epitope-base vaccine may be selected from conserved regions of viral or tumour-associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTI and HTI) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious. AAB98391 to AAB98477 represent polypeptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    can also be used in a tetramer staining assay to assess peripheral blue mononuclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treatment or prophylaxis of HPV infection, in persons who have manifested symptoms e.g. genital warts or neoplastic growth. The manifest of the symptoms of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses. ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC least three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV E6 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins CC of at least three different oncogenic HPV strains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.EE1.214, and that CC are directly or indirectly joined to one another in the same reading CC multi-epitope construct, a polypeptide comprising an amino acid sequence cc encoded by the polynucleotide, a composition (comprising the polynucleotide, a composition (comprising the cc polynucleotide, vector or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the colynucleotide, vector or polypeptide. The epitopes are derived from CC polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the E1, E2, E6 and E7 proteins. The cepitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or colypeptide is useful in preparing a composition for inducing an immune composition for inducing an immune against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Loc

                                                                                                                                                              ঠ
                                                                                                                                                                                                                                                                   construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the E1, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a defense against hypotein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide comprises a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes, useful in preparing a vaccine against HPV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a tetramer staining assay to assess peripheral blood mononuclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected.
                                                                                                                                                                                                                                                                                                                                         from conserved regions of viral or tumour-associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious. AAB98391 to AAB98477 represent polypeptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human papillomavirus; human leukocyte antigen; HLA; immune response; HPV; epitope; T cell; identification; vaccine; infection; genital wart;

                                                                                                                                                                                                                                                                                                        CC ADO44074 ADO44085 represent E6 polypeptides from human papillomaviruses. CC ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides. CC where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids 20, 26 or 91 of the sequence given in CC cheer sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) associated CC cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC diagnostic kit (for detecting an HPV B5 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising the presence of an oncogenic HPV E6 protein a system for detecting the CC presence of an oncogenic HPV E6 protein a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, where the first binding partner is a DDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins CC of at least three different oncogenic HPV strains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.

The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (CHPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading the multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector or polypeptide and acarrier), a cell c polynucleotide, vector or polypeptide and acarrier), a cell c (comprising the polynucleotide, vector or polypeptide, inducing an c immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the B1, E2, E6 and E7 proteins. The c epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or in the claims of the specification. The polynucleotide, vector or polypeptide in the tables referred to the claims of the specification. The polynucleotide, vector or polypeptide in the tables referred to the claims of the specification. The polynucleotide, vector or polypeptide in the claims of the specification. The polynucleotide, vector or polypeptide in the claims of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chen
                                                  polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the sequence is an HPV protein used to derive epitopes for the vaccine of the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide comprises a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes, useful in preparing a vaccine against HPV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-DEC-2003;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide and a carrier) and immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the E1, E2, E6 and E7 proteins. The
                                                                                                                                                                                      New polynucleotide comprises a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes, useful in preparing a vaccine against HPV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  31-DEC-2003;

                      The invention relates to an antibody composition comprising a mixtur monoclonal antibodies that specifically bind to E6 proteins of human papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least of the monoclonal antibodies specifically binds to E6 proteins of at least three different oncogenic HPV strains. Also included are a diagnostic kit (for detecting an HPV E6 polypeptide in a sample, composition above), a method of detecting an E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 protein in a sample and a system for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AEA98879

where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                first and a second binding partner for an oncogenic HPV E6 polypeptide, where the first binding partner is a PDZ domain protein and the second binding partner is an antibody that specifically binds to the E6 protein of at least three different oncogenic HPV strains). The antibody composition, kit, methods, and system are useful for diagnosing cancer, particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides,
                                                                                                                                                                                                                                                                                                                                                                         New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Smith

The invention relates to an antibody composition comprising a mixture of monoclonal antibodies that specifically bind to 86 proteins of human papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one of the monoclonal antibodies specifically binds to 86 proteins of at least three different oncogenic HPV strains. Also included are a diagnostic kit (for detecting an HPV 86 polypeptide in a sample, comprising the antibody composition above), a method of detecting an HPV 86 protein in a sample, a method of detecting the presence of an oncogenic HPV 86 protein in a sample and a system for detecting the presence of an oncogenic HPV 86 protein in a sample and a system for detecting the presence of an oncogenic HPV 86 polypeptide in a sample (comprising a first and a second binding partner for an oncogenic HPV 86 polypeptide, where the first binding partner is a PDZ domain protein and the second binding partner is an antibody that specifically binds to the 86 proteins of at least three different oncogenic HPV strains). The antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibody composition comprising a mixture of monoclonal antibodies for oncogenic strains of human papilloma virus, useful for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-JUN-2005

Also included are a vector comprising the completope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, a composition (comprising the polynucleotide, vector or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epicopes are derived from the coliferent strains of HPV and are from the El, E2, E6 and E7 proteins. The cepitopes may be linked via a GP-anchor/spacer peptide. The order of the cepitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune cressome against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a composition in the claims of the vaccine and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, a composition (comprising the polynucleotide, vector or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the CC polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the E1, E2, E6 and E7 proteins. The CC epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune CC defense against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a ference is an HPV protein used to derive epitopes for the vaccine of the convertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and mucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, and cancer, and other cancers of the reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
